<sup>2</sup>*University of Montana, Missoula, MT, USA*

GPS Data Processing and Analysis with GAMIT/GLOBK and track  
Hotel Soluxe, Bishkek, Kyrgyzstan  
2–7 July 2018

[http://geoweb.mit.edu/~floyd/courses/gg/201807\\_Bishkek/](http://geoweb.mit.edu/~floyd/courses/gg/201807_Bishkek/)

Material from R. W. King, T. A. Herring, M. A. Floyd (MIT) and S. C. McClusky (now at ANU)

# Raw data formats

# Motivation for Receiver INdependent EXchange (RINEX) format

- All manufacturers have developed their own proprietary file formats for data storage specific to their receivers and processing software
  - Problems occur when processing data from another manufacturer's receiver
- RINEX developed by the Astronomical Institute of the University of Berne to allow easy and universal exchange of raw GPS data
  - Principal driver was the large European GPS campaign EUREF 89 - involved more than 60 GPS receivers of 4 different manufacturers.

# RINEX formats

- RINEX 2
  - Short file names (explained in following slides)
- RINEX 3
  - Long file names (explained in following slides)
- GAMIT formerly worked with the RINEX 2 format and GPS observations only
- Support for RINEX 3 and GNSS (e.g. Galileo, BeiDou, etc.) observations are now available with GAMIT/GLOBK 10.61 and later
  - But RINEX 3 files need to be renamed, copied or linked with a RINEX 2 file name convention to be used (e.g. sh\_rename\_rinex3)

# RINEX 2 data format

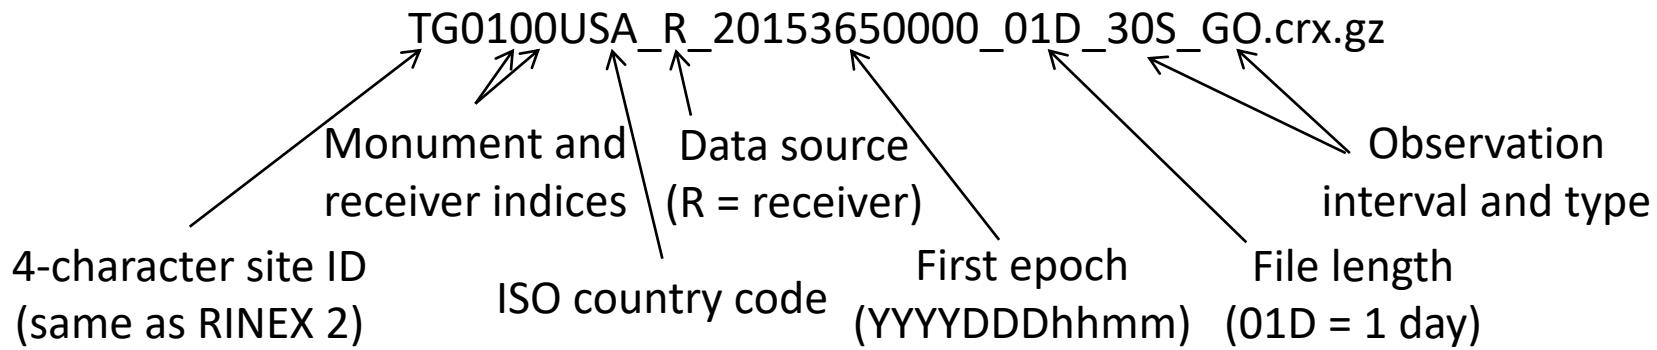

- Includes text file formats for:
  - observation (“o”)
  - navigation (“n”)
  - meteorological (“m”)
  - ionospheric data (“i”)
- Latest definition at <ftp://igs.org/pub/data/format/rinex211.txt>
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
  - Contains header labels in columns 61–80 for each line contained in the header section
  - These labels are mandatory and must appear exactly as per format description
- RINEX 2 filename convention:
  - For site “ssss”, on ordinal date (day-of-year) “ddd”, session “t” and year “yy”:
    - sssssddt.yyo (RINEX observation file, i.e. the site’s phase and code records)
    - sssssddt yyn (RINEX navigation file, i.e. the broadcast ephemeris)
  - e.g., hers1270.03o is observation data for Herstmonceux, day 127, session 0, year 2003
- All dates and times in GPST

# An example of RINEX 2 observation data

# RINEX 3 data format

- Must be able to accommodate increased number and complexity of observations from multi-GNSS observations (GPS, GLONASS, Galileo, BeiDou, etc.)
- Latest definition at <ftp://igs.org/pub/data/format/rinex303.pdf>
- Each file type consists of a header section and a data section
- Header section contains global information for the entire file and is placed at the beginning of the file.
  - Contains header labels in columns 61–80 for each line contained in the header section
  - These labels are mandatory and must appear exactly as per format description
- RINEX 3 filename convention is longer and more complicated than for RINEX 2, e.g.

**System now listed along with observation types**

Observation codes more complicated than RINEX 2 (see Tables 4–10 of current RINEX 3(.03) document)

# Compressing/Uncompressing RINEX

- File compression
  - “\*.zip” files
    - Unzip using “unzip”, “pkzip” or “WinZip”
    - See <http://www.pkware.com/> or <http://www.winzip.com/>, or <http://www.7-zip.org/>
  - “\*.**??o.Z**” (RINEX 2) and “\*.**.rnx.gz**” (RINEX 3) files (UNIX **compress** or **gzip**)
    - e.g., hers1270.03o.Z, TG0100USA\_R\_20153650000\_01D\_30S\_GO.rnx.gz
    - Uncompress using “uncompress”, “gunzip”, “7zip”, “WinZip” or similar
  - “\*.**??d.Z**” (RINEX 2) and “\*.**.crx.gz**” (RINEX 3) files (Hatanaka compression)
    - e.g., hers1270.03d.Z, TG0100USA\_R\_20153650000\_01D\_30S\_GO.crx.gz
    - Need to uncompress as above to get \*.**??d** and \*.**.crx** files
    - Then need to “unHatanaka” using CRX2RNX from <http://terras.gsi.go.jp/ja/crx2rnx.html>
  - Leica Geo Office uncompresses files automatically when using “Internet Download” tool
    - For manual import you need to uncompress the files manually

# runpkr00 (Trimble raw to dat)

- Proprietary software from Trimble
- Maintained by UNAVCO nowadays
  - <http://facility.unavco.org/kb/questions/744/>
- Converts raw data from Trimble receiver to teqc-compatible input “dat”-file, e.g.  
`runpkr00 -g -adeimv <raw file> [dat-file root]`
- Always use “–g” option and separately from other options

# Pre-processing data

- Some level of data quality control may be performed prior to any data processing
- Utilities are available to perform simple but valuable tests
  - The most common example is TEQC (pronounced “tek”)
    - Translate, Edit, Quality Check
    - Translates common binary formats to RINEX format
    - Header editing, windowing, splicing of RINEX data
    - Quality check in “lite” mode (no navigation file) or “full” mode (navigation file available)
    - Download for free from  
<http://www.unavco.org/facility/software/teqc/teqc.html#executables>

# Using teqc

- Be sure to use correct raw format

```
teqc -tr d <Trimble .dat file>  
teqc -ash d <Ashtech B-file, etc.>
```

- Ability to control observations using “-O.obs” option

```
teqc -O.obs L1L2C1P2 -tr d <Trimble .dat file>
```

- Ability to control header information with other “-O.xxx” options

```
teqc -O.o "M. Floyd" -O.obs L1L2C1P2 -tr d <Trimble .dat file>
```

- May create and use a teqc configuration file for consistent information

```
teqc -config teqc.cfg -tr d <Trimble .dat file>
```

- Use a script or command line loop to create RINEX files in batch

# Using teqc

- Quality Control (QC)
  - In “lite” mode, teqc doesn’t know anything about the satellite positions  
`teqc +qc site1891.02o > teqc.log`
    - 7 files generated; use the `-plots` option to prevent all but the summary ('S') file being generated
  - In “full” mode, additional information is available based on the satellite positions  
`teqc +qc -nav site1891.02n site1891.02o > teqc.log`
    - 9 files generated (elevation and azimuth of satellites)
  - Full solution if navigation file matches observation file, e.g. site1891.02o and site1891.02n  
`teqc +qc site1891.02o > teqc.log`

# Approximate position

Accurate a priori coordinates necessary for good GNSS processing

1. Run `teqc` to create RINEX observation and (broadcast) navigation files, e.g.

```
teqc +nav abcd3650.14n +obs abcd3650.14o -tr d 12343650.dat
```

2. Run `teqc` in qc-mode on observation file with navigation file to get pseudorange-derived estimate of approximate coordinate, e.g.

```
teqc +qc -nav abcd3650.14n abcd3650.14o
```

May also be done using GAMIT/GLOBK's `sh_rx2apr`
